

Lecture 7

Outline

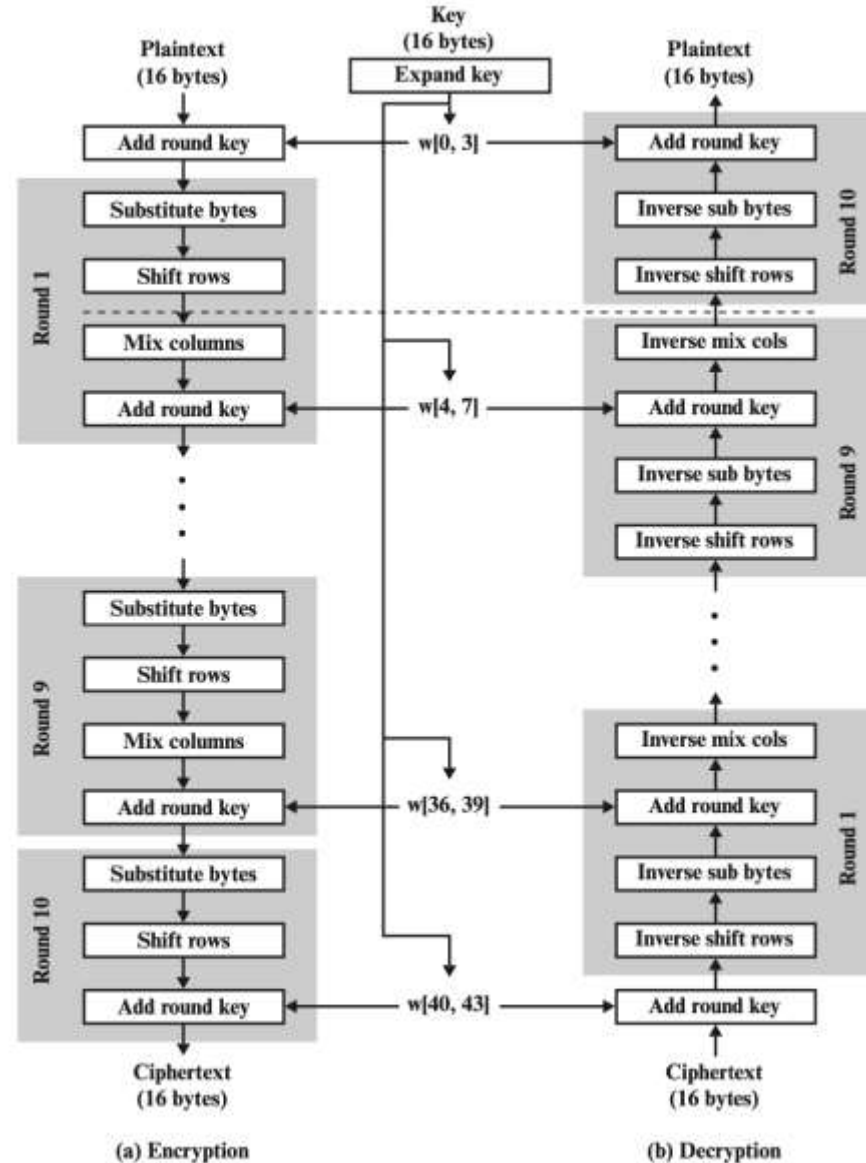

- AES
- Random number

Rijndael

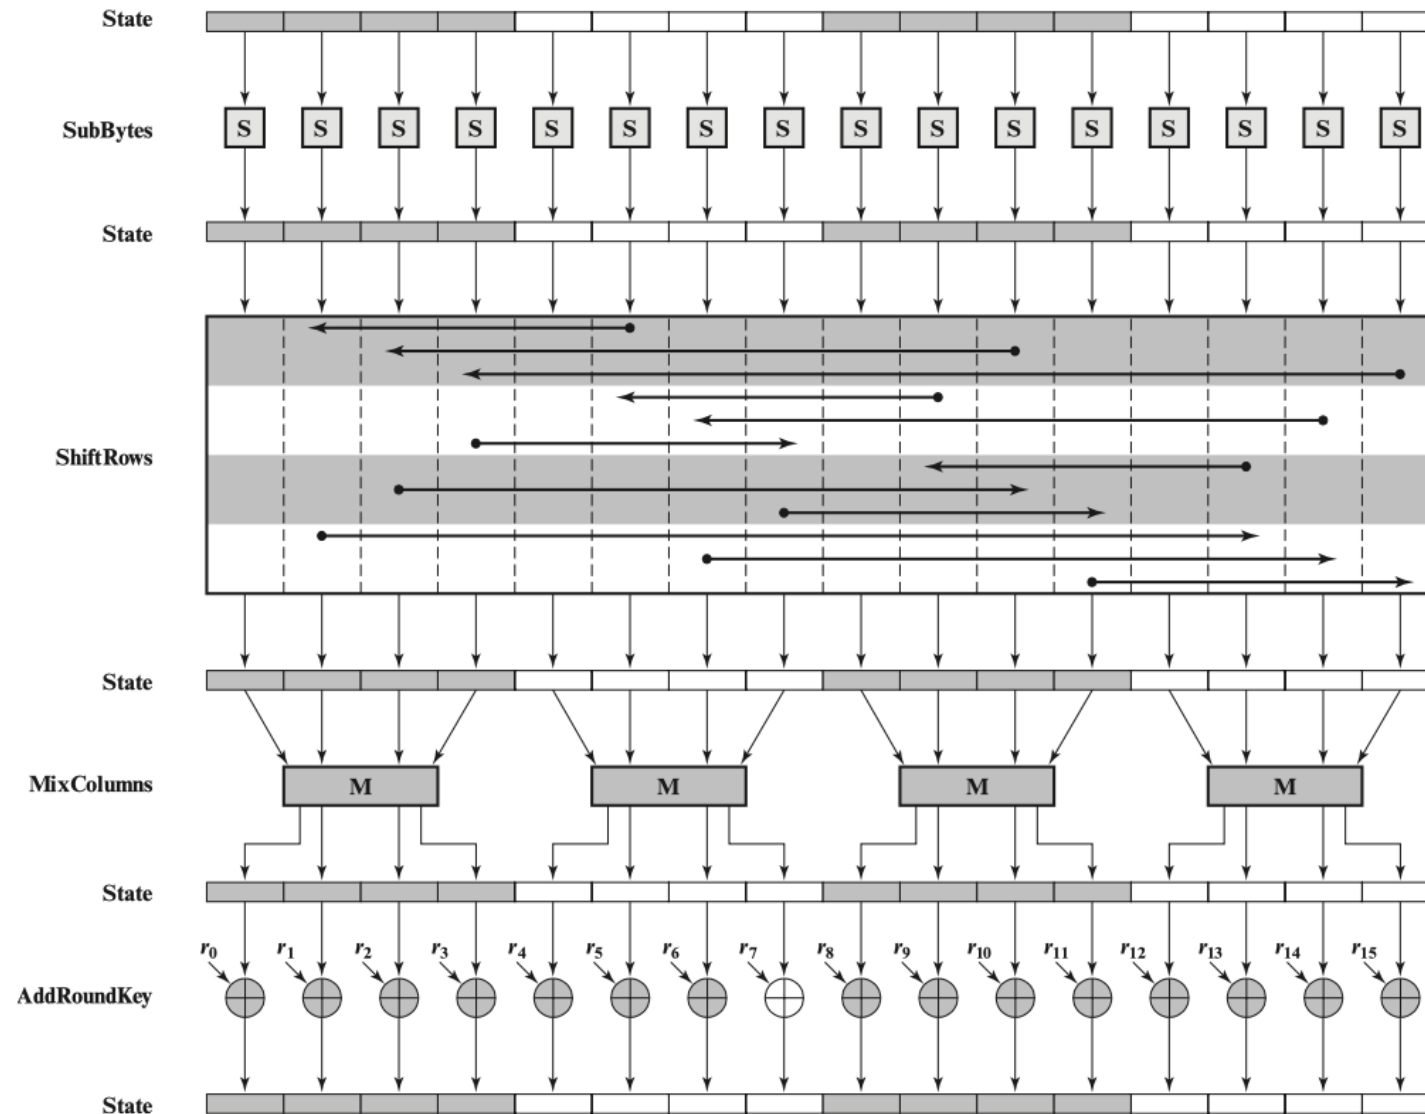

- processes data as 4 groups of 4 bytes (state) = 128 bits
- has 10/12/14 rounds in which state undergoes:
 - byte substitution (1 S-box used on every byte)
 - shift rows (permute bytes row by row)
 - mix columns (alter each byte in a column as a function of all of the bytes in the column)
 - add round key (XOR state with key material)
- 128-bit keys – 10 rounds, 192-bit keys – 12 rounds, 256-bit keys – 14 rounds

AES Encryption and Decryption

AES encryption round

AES pros

- Most operations can be combined into XOR and table lookups - hence very fast & efficient

Take-home Exercises

- Find an AES code to encrypt a text (A), then decrypt it and check whether the original text (A) equals the decrypted text (B). Whether $A = B$?
- Compare the decryption time with different key lengths, and with DES and 3DES.
 - Suggestions: find a large A file. Run decryption a couple of times and take the average.
